Ichiro Hashimoto

University of Toronto

July 19, 2023

 Image: Image

# Recap

Learnt in last module:

- Joint and marginal distributions
  - ▷ Joint cumulative distribution function
  - Independence of continuous random variables
- Functions of random variables
  - $\triangleright$  Convolutions
  - $\triangleright$  Change of variables
  - Order statistics

# Outline

• Moments

- ▷ Expectation, Raw moments, central moments
- Moment-generating functions
- Change-of-variables using MGF
  - ▷ Gamma distribution
  - > Chi square distribution
- Conditional expectation
  - $\,\triangleright\,$  Law of total expectation
  - $\,\triangleright\,$  Law of total variance

Intuition: How do the random variables behave on average?

#### Intuition: How do the random variables behave on average?

#### Expectation

Consider a random vector X and function  $g(\cdot)$ , the expectation of g(X) is defined by  $\mathbb{E}(g(X))$ , where

• Discrete random vector

$$\mathbb{E}(g(X)) = \sum_{x} g(x) p_X(x),$$

Continuous random vector

$$\mathbb{E}(g(X)) = \int_{-\infty}^{\infty} g(x) \ dF(x) = \int_{-\infty}^{\infty} g(x) f_X(x) \ dx.$$

<ロ > < 合 > < 言 > < 言 > こ > < つ へ () July 19, 2023 4/1

#### Examples (random variable)

- $X \sim \text{Bernoulli}(p)$ :  $\mathbb{E}(X) = p \cdot 1 + (1-p) \cdot 0 = p$ .
- $X \sim \mathcal{N}(0, 1)$ :

$$\mathbb{E}(X) = \int_{-\infty}^{\infty} x \frac{1}{\sqrt{2\pi}} exp(-\frac{x^2}{2}) dx = 0.$$

#### Examples (random variable)

- $X \sim \text{Bernoulli}(p)$ :  $\mathbb{E}(X) = p \cdot 1 + (1-p) \cdot 0 = p$ .
- $X \sim \mathcal{N}(0,1)$ :

$$\mathbb{E}(X) = \int_{-\infty}^{\infty} x \frac{1}{\sqrt{2\pi}} exp(-\frac{x^2}{2}) dx = 0.$$

#### Examples (random vector)

• 
$$X_i \sim \text{Bernoulli}(p_i), i = 1, 2$$
:

$$\mathbb{E}\left((X_1,X_2^2)^{\top}\right) = \left((\mathbb{E}(X_1),\mathbb{E}(X_2^2))^{\top}\right) = (p_1,p_2)^{\top}.$$

#### **Properties:**

- $\mathbb{E}(X + Y) = \mathbb{E}(X) + \mathbb{E}(Y);$
- $\mathbb{E}(aX+b) = a\mathbb{E}(X) + b;$
- $\mathbb{E}(XY) = \mathbb{E}(X)\mathbb{E}(Y)$ , when X, Y are independent.

#### Proof of the first property:

#### Raw moments

Consider a random vector X, the k-th (raw) moment of X is defined by  $\mathbb{E}(X^k)$ , where

• Discrete random vector

$$\mathbb{E}(X^k) = \sum_{x} x^k p_X(x)$$

• Continuous random vector

$$\mathbb{E}(X^k) = \int_{-\infty}^{\infty} x^k \, dF(x) = \int_{-\infty}^{\infty} x^k f_X(x) \, dx.$$

#### **Remark:**

#### Central moments

Consider a random vector X, the k-th central moment of X is defined by  $\mathbb{E}((X - \mathbb{E}(X))^k)$ .

#### Remark:

- The first central moment is 0
- Variance is defined as the second central moment.

#### Variance

The variance of a random variable X is defined as

$$Var(X) = \mathbb{E}((X - \mathbb{E}(X))^2) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2.$$

#### Another look at the moments:

#### Moment generating function (1-dimensional)

For a random variable X, the moment generating function (MGF) is defined as

$$M_X(t) = \mathbb{E}\left[e^{tX}
ight] = 1 + t\mathbb{E}(X) + rac{t^2\mathbb{E}(X^2)}{2!} + rac{t^3\mathbb{E}(X^3)}{3!} + \cdots + rac{t^n\mathbb{E}(X^n)}{n!} + \cdots$$

#### Another look at the moments:

#### Moment generating function (1-dimensional)

For a random variable X, the moment generating function (MGF) is defined as

$$M_X(t) = \mathbb{E}\left[e^{tX}
ight] = 1 + t\mathbb{E}(X) + rac{t^2\mathbb{E}(X^2)}{2!} + rac{t^3\mathbb{E}(X^3)}{3!} + \cdots + rac{t^n\mathbb{E}(X^n)}{n!} + \cdots$$

#### Compute moments based on MGF:

#### Moments from MGF

$$\mathbb{E}(X^k) = \frac{d^k}{dt^k} M_X(t)|_{t=0}.$$

<ロ>< (日)> < (H)> < (H

**Relationship between MGF and probability distribution:** MGF uniquely defines the distribution of a random variable.

< □ ▶ < 클 ▶ < 클 ▶ < 클 ▶ ミ ラ Q (℃ July 19, 2023 10/1

**Relationship between MGF and probability distribution:** MGF uniquely defines the distribution of a random variable.

#### Example:

•  $X \sim Bernoulli(p)$ 

$$M_X(t)=\mathbb{E}(e^{tX})=e^0\cdot(1-p)+e^t\cdot p=pe^t+1-p.$$

• Conversely, if we know that

$$M_Y(t)=\frac{1}{3}e^t+\frac{2}{3}$$

it shows  $Y \sim \text{Bernoulli}(p = \frac{1}{3})$ .

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

**Intuition:** To get the distribution of a transformed random variable, it suffices to find its MGF first.

**Properties:** 

- Y = aX + b,  $M_Y(t) = \mathbb{E}(e^{t(aX+b)}) = e^{tb}M_X(at)$ .
- $X_1, \dots, X_n$  independent,  $Y = \sum_{i=1}^n X_i$ , then  $M_Y(t) = \prod_{i=1}^n M_{X_i}(t)$ .

**Intuition:** To get the distribution of a transformed random variable, it suffices to find its MGF first.

**Properties:** 

- Y = aX + b,  $M_Y(t) = \mathbb{E}(e^{t(aX+b)}) = e^{tb}M_X(at)$ .
- $X_1, \dots, X_n$  independent,  $Y = \sum_{i=1}^n X_i$ , then  $M_Y(t) = \prod_{i=1}^n M_{X_i}(t)$ .

#### Remark:

 $\mathsf{MGF}$  is a useful tool to find the distribution of some transformed random variables, especially when

- The original random variable follows some special distribution, so that we already know / can compute the MGF.
- The transformation on the original variables is linear, say  $\sum_i a_i X_i$ .

#### Example: Gamma distribution

$$X \sim \Gamma(\alpha, \beta),$$
  
 $f(x; \alpha, \beta) = \frac{x^{\alpha-1}e^{-\beta x}\beta^{\alpha}}{\Gamma(\alpha)} \quad \text{ for } x > 0 \quad \alpha, \beta > 0.$ 

Compute the MGF of  $X \sim \Gamma(\alpha, \beta)$  (details omitted),

$$M_X(t) = \left(1 - rac{t}{eta}
ight)^{-lpha}$$
 for  $t < eta,$  does not exist for  $t \ge eta.$ 

< □ ▶ < □ ▶ < ■ ▶ < ■ ▶ < ■ ▶ < ■ > ○ Q (~ July 19, 2023 12/1

#### Example: Gamma distribution

#### **Observation:**

The two parameters  $\alpha, \beta$  play different roles in variable transformation.

#### • Summation:

If  $X_i \sim \Gamma(\alpha_i, \beta)$ , and  $X_i$ 's are independent, then  $T = \sum_i X_i \sim \Gamma(\sum_i \alpha_i, \beta)$ . If  $X_i \sim Exp(\lambda)$  (this is equivalently  $\Gamma((\alpha_i = 1, \beta = \lambda))$  distribution), and  $X_i$ 's are independent, then  $T = \sum_i X_i \sim \Gamma(n, \lambda)$ .

• Scaling:

If 
$$X \sim \Gamma(\alpha, \beta)$$
, then  $Y = cX \sim \Gamma(\alpha, \frac{\beta}{c})$ .

**Example:**  $\chi^2$  distribution

## $\chi^{\rm 2}$ distribution

If  $X \sim \mathcal{N}(0,1)$ , then  $X^2$  follows a  $\chi^2(1)$  distribution.

### Find the distribution of $\chi^2(1)$ distribution

• From PDF: (Module 4, Problem 2) For X with density function  $f_X(x)$ , the density function of  $Y = X^2$  is

$$f_Y(y) = rac{1}{2\sqrt{y}}(f_X(-\sqrt{y})+f_X(\sqrt{y})), \quad y \ge 0,$$

this gives

$$f_Y(y) = \frac{1}{\sqrt{2\pi}}y^{-\frac{1}{2}}exp(-\frac{y}{2}).$$

July 19, 2023 14/1

Find the distribution of  $\chi^2(1)$  distribution (continued)

• From MGF:

$$\begin{split} \mathcal{M}_{Y}(t) &= \mathbb{E}(e^{tX^{2}}) = \int_{-\infty}^{\infty} exp(tx^{2}) \frac{1}{\sqrt{2\pi}} exp(-\frac{x^{2}}{2}) \ dx \\ &= \int_{-\infty}^{\infty} \frac{1}{\sqrt{2\pi}} exp\left(-\frac{x^{2}}{2(1-2t)^{-1}}\right) \ dx \\ &= (1-2t)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \mathcal{N}(0, (1-2t)^{-1}) \ dx, \quad t < \frac{1}{2} \\ &= (1-2t)^{-\frac{1}{2}}, \quad t < \frac{1}{2}. \end{split}$$

By observation,  $\chi^2(1) = \Gamma(\frac{1}{2}, \frac{1}{2}).$ 

<□ ト < □ ト < ■ ト < ■ ト < ■ ト = つへで July 19, 2023 15/1

#### Generalize to the $\chi^2(d)$ distribution

# $\chi^2(d)$ distribution If $X_i$ , $i = 1, \dots, d$ are i.i.d $\mathcal{N}(0, 1)$ random variables, then $\sum_{i=1}^d X_i^2 \sim \chi^2(d)$ .

By properties of MGF,  $\chi^2(d) = \Gamma(\frac{d}{2}, \frac{1}{2})$ , and this gives the PDF of  $\chi^2(d)$  distribution

$$\frac{x^{\frac{d}{2}-1}e^{-\frac{x}{2}}}{2^{\frac{d}{2}}\Gamma(\frac{d}{2})} \quad \text{ for } x > 0$$

#### From expectation to conditional expectation:

How will the expectation change after conditioning on some information?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

#### From expectation to conditional expectation:

How will the expectation change after conditioning on some information?

#### Conditional expectation

If X and Y are both discrete random vectors, then for function  $g(\cdot)$ ,

• Discrete:

$$\mathbb{E}(g(X) \mid Y = y) = \sum_{x} g(x) p_{X|Y=y}(x) = \sum_{x} g(x) \frac{P(X = x, Y = y)}{P(Y = y)}$$

• Continuous:

$$\mathbb{E}(g(X) \mid Y = y) = \int_{-\infty}^{\infty} g(x) f_{X|Y}(x|y) \mathrm{d}x = \frac{1}{f_Y(y)} \int_{-\infty}^{\infty} g(x) f_{X,Y}(x,y) \mathrm{d}x.$$

#### **Properties:**

• If X and Y are independent, then

 $\mathbb{E}(X \mid Y = y) = \mathbb{E}(X).$ 

• If X is a function of Y, denote X = g(Y), then

$$\mathbb{E}(X \mid Y = y) = g(y).$$

Sketch of proof:

#### **Remark:**

By changing the value of Y = y,  $\mathbb{E}(X \mid Y = y)$  also changes, and  $\mathbb{E}(X \mid Y)$  is a random variable (the randomness comes from Y).

#### Remark:

By changing the value of Y = y,  $\mathbb{E}(X \mid Y = y)$  also changes, and  $\mathbb{E}(X \mid Y)$  is a random variable (the randomness comes from Y).

#### Total expectation and conditional expectation

Law of total expectation

 $\mathbb{E}(\mathbb{E}(X \mid Y)) = \mathbb{E}(X)$ 

**Proof: (discrete case)** 

Total variance and conditional variance

Conditional variance

$$Var(Y \mid X) = \mathbb{E}(Y^2 \mid X) - (\mathbb{E}(Y \mid X))^2.$$

#### Total variance and conditional variance

Conditional variance

$$Var(Y \mid X) = \mathbb{E}(Y^2 \mid X) - (\mathbb{E}(Y \mid X))^2.$$

#### Law of total variance

$$Var(Y) = \mathbb{E}[Var(Y \mid X)] + Var(\mathbb{E}[Y \mid X]).$$

#### **Remark:**

<ロ > < 合 > < 言 > < 言 > こ > < こ > < つ へ ? July 19, 2023 20/1

## **Problem Set**

**Problem 1:** Prove that  $\mathbb{E}(XY) = \mathbb{E}(X)\mathbb{E}(Y)$  when X and Y are independent. (Hint: simply consider the continuous case, use the independent property of the joint pdf)

**Problem 2:** For  $X \sim Uniform(a, b)$ , compute  $\mathbb{E}(X)$  and Var(X).

**Problem 3:** Determine the MGF of  $X \sim \mathcal{N}(\mu, \sigma^2)$ . (Hint: Start by considering the MGF of  $Z \sim \mathcal{N}(0, 1)$ , and then use the transformation  $X = \mu + \sigma Z$ )

## **Problem Set**

**Problem 4:** The citizens of Remuera withdraw money from a cash machine according to X = 50, 100, 200 with probability 0.3, 0.5, 0.2, respectively. The number of customers per day has the distribution  $N \sim Poisson(\lambda = 10)$ . Let  $T_N = X_1 + X_2 + \cdots + X_N$  be the total amount of money withdrawn in a day, where each  $X_i$  has the probability above, and  $X_i$ 's are independent of each other and of N.

- Find  $\mathbb{E}(T_N)$ ,
- Find  $Var(T_N)$ .
